EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows:

IN THE CLAIMS

Claim 1, line 14, the word -- the -- has been inserted after the word "as".

See claim 1, lines 2-3. The subsequent mention of an element is to be modified by the definite article "the", "said" or "the said," thereby making the latter mention(s) of the element unequivocally referable to its earlier recitation.

REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance:

Claims **1-5, 8, 10-13, 15-16 and 19** are allowable over the prior art of record because the prior art does not teach or suggest an electrolytic phosphate chemical treatment method of forming a film composed of a phosphate compound and a metal that is reduced and precipitated from an ionic state on the surface of a metal material article to be treated, comprising the step of performing as presently claimed, esp., wherein NO₂ and/or N₂O₄ gas generated and dissolved in the phosphate chemical treatment bath during a reduction reaction of the nitrate ions of the electrolytic treatment

is removed from the treatment bath by separating a treatment tank into an electrolytic treatment tank where the electrolytic treatment is carried out and an auxiliary tank where no electrolytic treatment is carried out, circulating the treatment bath between the two tanks, and providing a mechanism that opens the treatment bath to the atmosphere at a reduced pressure either between the two tanks or within the two tanks, as a means of separating the NO₂ and/or N₂O₄ gas from the treatment bath.

The prior art does not contain any language that teaches or suggests the above. EP 1,074,640 and Matsuda do not teach wherein NO₂ and/or N₂O₄ gas generated and dissolved in the phosphate chemical treatment bath during a reduction reaction of the nitrate ions of the electrolytic treatment is removed from the treatment bath by separating a treatment tank into an electrolytic treatment tank where the electrolytic treatment is carried out and an auxiliary tank where no electrolytic treatment is carried out, circulating the treatment bath between the two tanks, and providing a mechanism that opens the treatment bath to the atmosphere at a reduced pressure either between the two tanks or within the two tanks, as a means of separating the NO₂ and/or N₂O₄ gas from the treatment bath. Therefore, a person skilled in the art would not have been motivated to adopt the above conditions, and a *prima facie* case of obviousness cannot be established.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on

Statement of Reasons for Allowance."

Citations

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Nishiya et al. (US Patent No. 6,984,300 B2) is cited to teach:

Next, means employed in the present invention for separating NO₂, N₂O₄ and/or NO, the gas generated in the treatment bath as electrolytic treatment proceeds, will be explained. Advantageously, by separating the phosphate chemical treatment tank into an electrolytic treatment tank that performs electrolytic treatment and an auxiliary tank that does not perform electrolytic treatment, and circulating the treatment bath between the two tanks, and providing a mechanism for exposing the treatment liquid to the atmosphere between the two tanks, or in the two tanks, NO, NO₂ and/or N₂O₄, that is, the gas generated and dissolved in the electrolytic treatment tank, can be removed from the bath. In the above-mentioned auxiliary tank that does not perform electrolytic treatment, a mechanism for causing the treatment liquid to pass through a net-like solid structure may be provided, or a filtration system having a mechanism for filtering the treatment bath may be advantageously employed. Further, a liquid circuit may be advantageously provided in which a portion of the treatment liquid is extracted at a position prior to being led to a filter member in the filtration system, and is exposed to atmosphere to remove the nitrogen oxides that exists in the treatment liquid, and then is returned to the electrolytic treatment tank (col. 7, lines 45-67).
